PLACEMENT PLAN

Visuals that do explanatory work

Keep the restored research narrative. Add visual space where the relationships, mechanisms, or evidence are difficult to picture.

02 / Overview	Three connected research questions A visual index that explains what each stream studies and how the streams inform one another.	A
03 / Coaching model	How expertise becomes usable A small network or mediation diagram: coaches translate experience, connect peers, and structure requests.	Later
04 / Coaching system	Two roles, one conversation A workflow plus a companion page of actual screenshots. Show different support for novice and mentor, and the editable expert model.	B + C
06-07 / Multimodal studies	From video to interpretable evidence A simplified pipeline, a visible human-validation branch, then a readable episode and exchange example.	D + E
08 / Double compression	Two stages, two types of narrowing A conceptual comparison of generation and evaluation; clearly separate a schematic from a measured result.	F
09 / Participation and influence	Who supplies input; who decides? A flow of reporting, classification, and response with control points marked.	G
10 / Experience	A compact research-to-practice timeline Optional: small role labels or a shared-workflow diagram. Keep the personal prose; avoid decorative skill icons.	Later

LAYOUT INTENT

Recommended first pass: B+C, D+E, and F. Add A to orient readers; G is useful if space allows. Allow the portfolio to grow beyond ten pages rather than replacing explanations with figures.

A / CURRENT PAGE 2

Three connected directions

A map of the research program, not a claim that one study causally proves the next.

01

Making expertise usable

What do collaborators need to articulate and share?

Coaching model + AI system / Workplace learning + tacit judgment

02

Understanding collaboration

How does collective work unfold in interaction?

Multimodal measurement / Scientific teams + pitching + sports

03

AI and collective outcomes

What range of ideas and judgments does the collective produce?

Double compression / Participation + decision authority

Shared design question: How can AI support collaboration while preserving human interpretation, diverse perspectives, and meaningful influence?

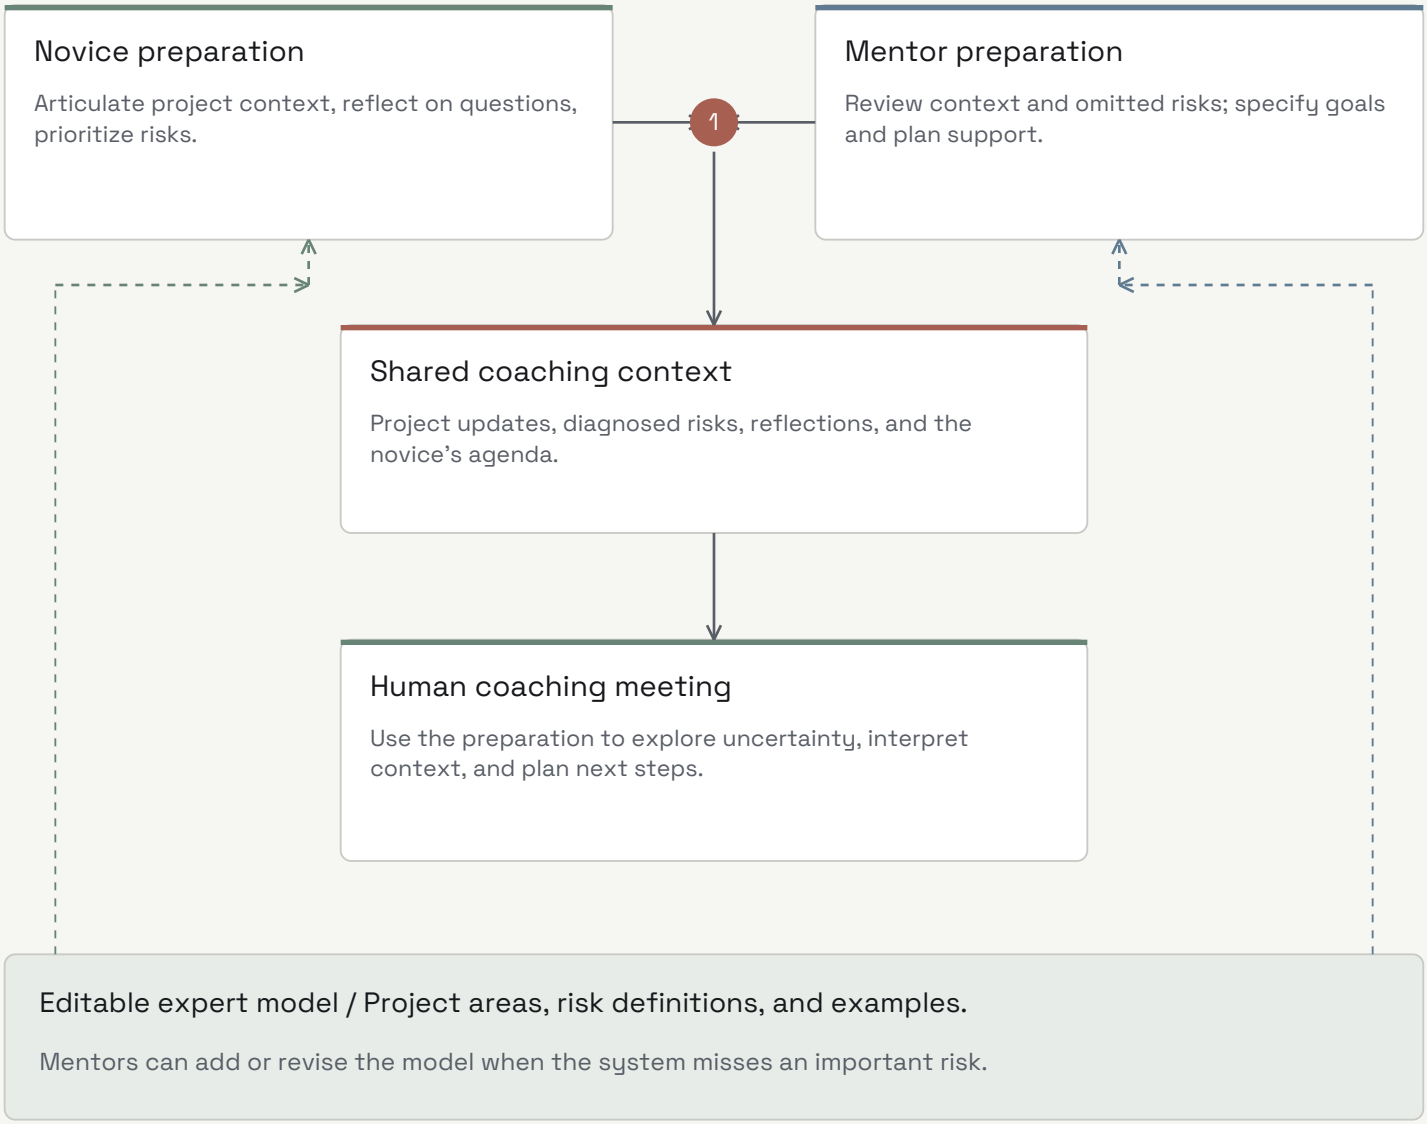

LAYOUT INTENT

Use as the visual index alongside the fuller overview text. Repeated 01 / 02 / 03 markers can identify each stream throughout the portfolio. Color distinguishes topics without implying a sequence.

B / CURRENT PAGE 4

Two roles, one conversation

AI prepares collaborators differently; the mentor can also revise the knowledge that guides the system.

Model informs both roles

Adapted conceptually from Huang, Easterday & Gerber (2025), Figs. 1 and 5. doi:10.1145/3757549. New portfolio drawing; not a new result.

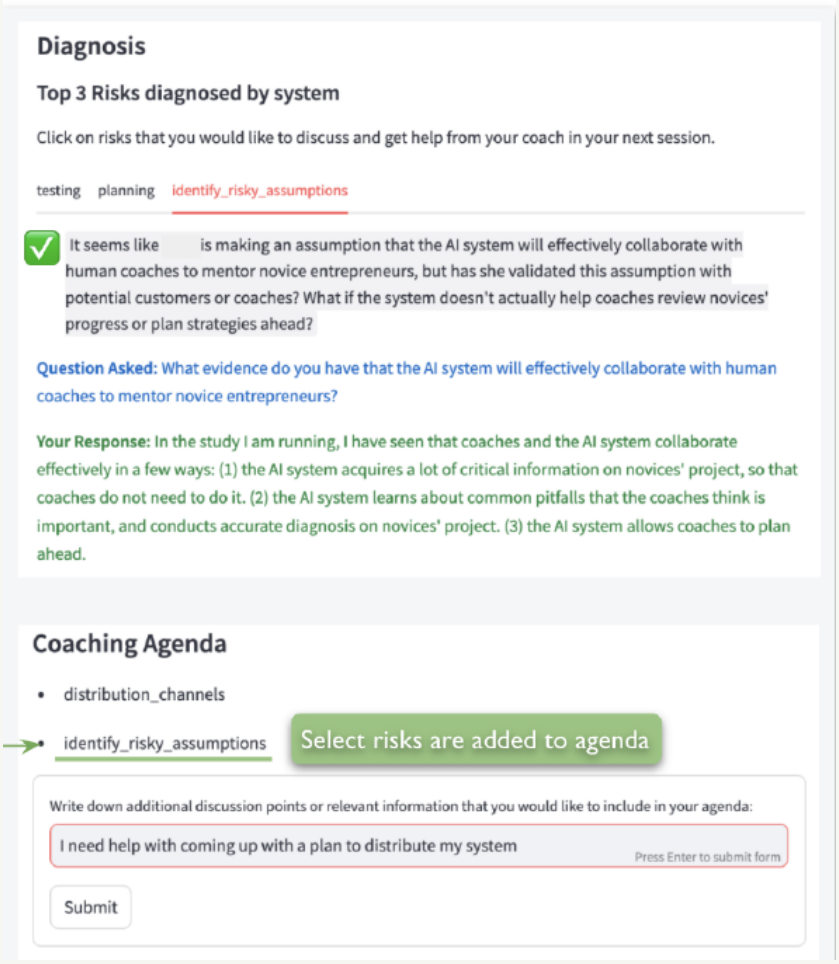

LAYOUT INTENT

A half-page workflow on the narrative page, with the interface evidence on a facing or following page. Solid arrows show preparation; dashed lines show how the editable model guides future support.

C / COMPANION TO CURRENT PAGE 4

Show the system, not only describe it

Use selected, readable interface excerpts to demonstrate the design contribution.

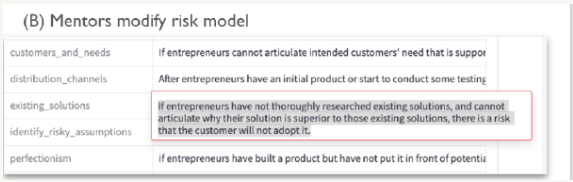

1 Make risks discussable

The novice sees the diagnosis, the question, and their own response together. The interface helps turn a model output into a subject for reflection.

2 Choose a meeting agenda

The novice chooses which risks to discuss and can add other concerns. Preparing a human conversation is the point of the interaction.

3 Revise the expert model

Mentors can edit risk definitions, not only accept or reject an answer.

Actual screenshot excerpts: Huang, Easterday & Gerber (2025), Fig. 3B and Fig. 4B, p. 9. Cropped from the supplied paper; original annotations retained. CC BY 4.0.

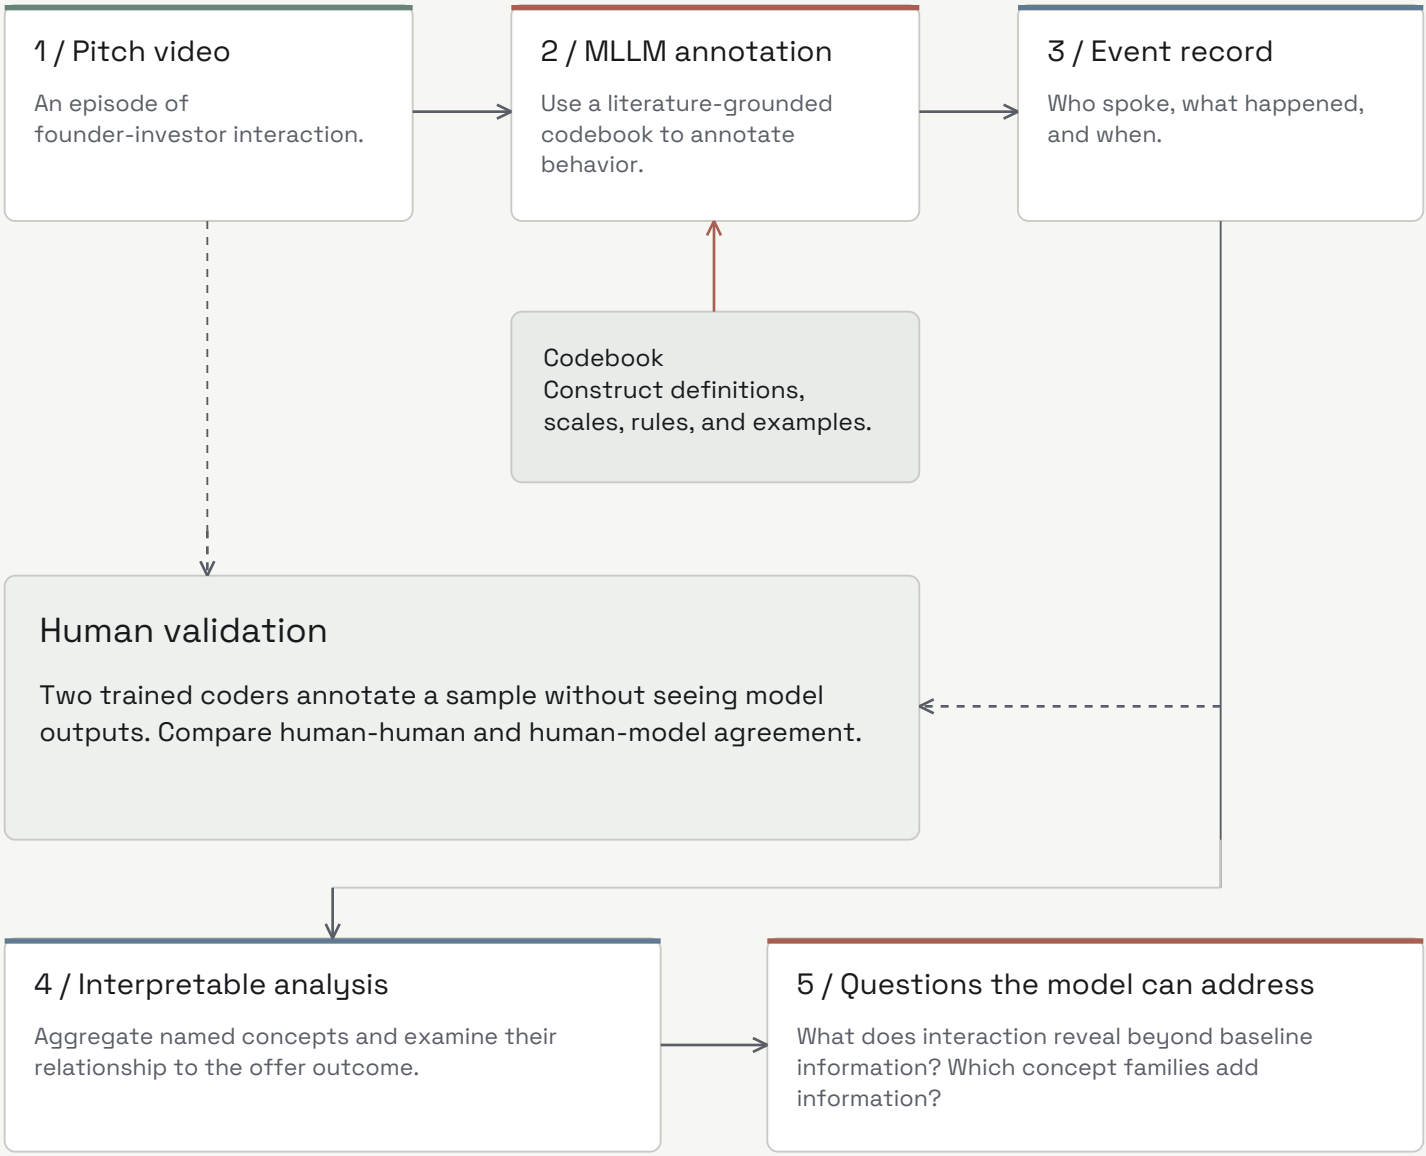

LAYOUT INTENT

Use the novice dashboard as the main image and the authoring interface as a supporting detail. Preserve the full study methods, findings, and limitations on the adjacent narrative page.

D / CURRENT PAGES 6-7

From interaction to behavioral evidence

A simplified reading path through the entrepreneurship measurement pipeline, with validation visibly separate from prediction.

Adapted from the supplied entrepreneurship Fig. 1 (working pipeline). No percentage bars or performance claims are reproduced. Pipeline structure is a method illustration, not validation evidence.

LAYOUT INTENT

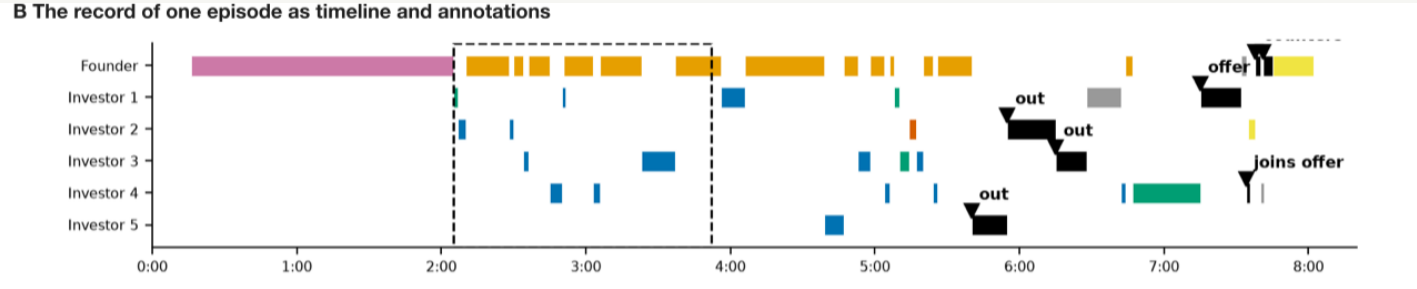

Use the full technical Fig. 1 only as a linked supplement. Keep this portfolio figure readable: five stages, one codebook, one validation branch. Exact sample counts and model versions can go in the caption.

E / COMPANION TO CURRENT PAGE 7

What a behavioral record looks like

Pair a whole-episode view with a guide to the coding fields so readers can see what the pipeline makes observable.

01 / THE EPISODE

The record distinguishes speakers, actions, and decision moments over time. It supports questions about sequences of interaction, rather than only total speaking time.

02 / HOW TO READ AN EXCHANGE

Investor question

Topic and question type: ask, substantiate, or contest.

linked to

Founder response

Answer substance and grounding in a checkable specific.

What this record lets you study

The analysis can follow which answer responds to which question, the topic under discussion, and how the exchange develops. An event sequence retains context that a total speaking-time measure loses.

Upper image: supplied Fig. 1, panel B (draft). Lower image: new conceptual reading guide to the same coding structure. The draft illustration is not presented as a validated finding.

LAYOUT INTENT

The episode is an actual excerpt from the supplied draft; the lower diagram explains the coding fields without inventing values. Re-export the original timeline with larger vector labels for final publication.

F / CURRENT PAGE 8

Two forms of compression

Show why producing plausible individual outputs is different from preserving diversity across a collection.

CONCEPTUAL ILLUSTRATION / NOT EMPIRICAL DATA

GENERATION

Breadth of candidate ideas

Human proposals / schematic

vs.

Similar territory; uneven concentration

AI proposals / schematic

EVALUATION

Different reasons to question an idea

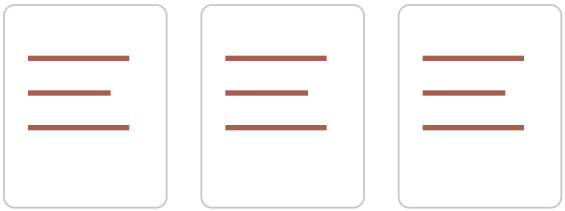

Human reviews / schematic

vs.

More similar evaluative perspectives

AI reviews / schematic

The two stages differ. Generation can underrepresent distinctive possibilities. Evaluation can converge in judgment even when reviews cover much of the same semantic territory.

New explanatory schematic based on the portfolio's working-manuscript account of Double Compression. Dots and marks are symbolic; they are not the study observations or estimated effect sizes.

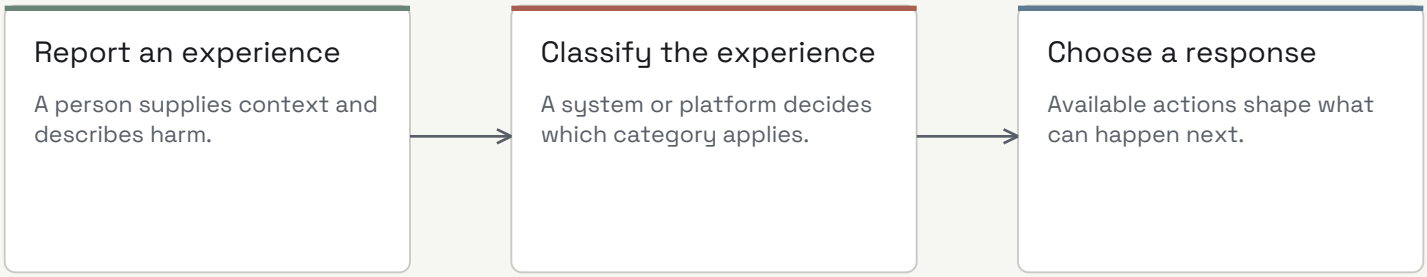

LAYOUT INTENT

Place alongside the findings, with the computational design and limitations kept in full. If validated result figures are supplied later, a measured plot can replace this schematic. Avoid fabricated percentages or axes.

G / CURRENT PAGE 9

Participation and decision authority

A compact diagram makes the distinction between contributing information and controlling a consequential decision visible.

1

Who is heard?

Whose experiences and risks inform the design?

2

Who defines?

Whose definitions count as harm? Can people contest them?

3

Who can act?

Who selects the response, and what choices are available?

The connection to collective AI

The same distinction appears when mentors revise an expert model, teams interpret behavioral measurements, or evaluators shape which scientific ideas receive support. These are connections across the research program, not outcomes all tested in the harassment review.

A small decision-flow is more informative here than a generic shield, warning symbol, or AI icon.

New conceptual diagram based on Huang et al. (2024), Opportunities, Tensions, and Challenges in Computational Approaches to Addressing Online Harassment. doi:10.1145/3643834.3661623.

LAYOUT INTENT

Add this as a half-page figure beside the review findings. Retain the distinction between documented reporting gaps and demonstrated system failures. The diagram summarizes an analytic question, not every tool in the review.
